Mice were maintained for 2 weeks on a liquid diet containing nicotine at concentrations of 0.1-1.0 mg/ml or on water, followed by a 2-week period of abstinence, after which the daily amount of nicotine consumed and the time spent in nicotine consumption were estimated. The mortality rate was increased in mice exposed to nicotine for 8 days but not in those maintained on nicotine for longer periods. Acute nicotine administration had no effect on the mortality rate. Nicotine consumption was also measured at increasing doses. The lethal dose of nicotine was only slightly increased by 2 weeks of abstinence. In contrast, mice maintained on a continuous supply of nicotine for 2 weeks were found to consume an increased amount of nicotine, and, on withdrawal, to have higher mortality rates than controls. There were also changes in the behavior of the mice. The percentage 82157476af
